

Imprivata OneSign Secure Walk-Away

For More Effective Data Breach Protection

Benefits

- Protects organizational assets from unauthorized access
- Improves employee productivity and satisfaction by automating desktop locking and hands free re-authentication
- Prevents employees from sharing sessions, improving overall compliance

Unattended Desktops Put Organizational Assets at Risk

Today, the fastest growing risk to the protection of enterprise information assets such as loan applications, financial transactions and intellectual property is from inside the organization. Research finds that 75% of all fraud and theft is perpetrated by trusted employees and contractors.

When desktops are located in highly accessible areas, shared amongst multiple users or even confined within high security zones they are often left open to unauthorized access.

Traditional solutions for this problem, including hot-key logoffs and inactivity timers, are problematic:

- Requiring manual logouts rely on a user who might forget.
- Automated inactivity timeouts are easily defeated if someone walks up to the workstation during the timeout countdown.
- Requiring a new login in each time the user returns is time consuming and inefficient.

Unattended workstations expose the organization to the increased risk of a security breach and violation of data protection regulations.

Automated Lockdown and Re-authentication

Imprivata OneSign Secure Walk-Away® closes this critical security gap by automating the process of securing the desktop when a user walks away, whether for just a moment or for hours, as well as automating re-authentication upon their return.

Automatic lockdown

When a user authenticates with Imprivata OneSign®, the solution uses a combination of facial recognition and active presence detection technologies to identify the presence of that user. When the user leaves the workstation, it automatically locks down the session.

Employees can focus on their work, without having to remember to logoff the desktop when they step away for a moment or longer.

About Imprivata

With more than two million users, Imprivata is the leading provider of authentication and access management solutions. By strengthening user authentication, streamlining application access and simplifying compliance reporting across multiple computing environments, customers realize improved workflows, as well as increased security and compliance with government regulations.

Imprivata has received numerous product awards and top review ratings from leading industry publications and analysts, including a Strong Positive rating in Gartner's latest ESSO Marketscope report.

Automatic re-authentication

When the user returns, Imprivata OneSign Secure Walk-Away compares the returning user to the facial recognition template created for the authenticated user in that session. If it is the same person, Imprivata OneSign Secure Walk-Away automatically re-authenticates the user and logs them back into their desktop in its current state—with no clicks or keystrokes required.

If a different person steps up to the workstation, they must authenticate to access their own desktop, and will not see the previous user's desktop. This prevents the possibility of unauthorized access to organizational assets.

Protecting Unattended Desktops from Unauthorized Access

Imprivata OneSign Secure Walk-Away helps organizations comply with federal and state regulations for data security by demonstrating that their data is automatically safeguarded from unauthorized access at the workstation.

Improve Employee Productivity and Satisfaction

Imprivata OneSign Secure Walk-Away removes the security burden from the user, reducing the time and frustration associated with logging on and off, resulting in improved employee productivity and satisfaction.

Workflow Customization

Imprivata OneSign Secure Walk-Away supports the varying conditions in the differing business environments. Multiple photographic, infrared, and 3D sensors provide superior facial recognition performance in high light, low light, and changing lighting conditions.

Re-authentication parameters can be fully customized to any workflow. Administrators have full control over timeout lengths and fade durations that apply to automatic re-authentication and workstation locking.

No facial data or images are permanently stored on the workstation or the server. When the user disconnects, Imprivata OneSign Secure Walk-Away removes all facial templates from memory.
