imprivata®

Imprivata Identity Governance and Cerner Millennium

Enforce secure access and corporate compliance policies with Cerner Millennium by reporting who has access to which systems and data by user, job role, or company

The integration of Imprivata Identity Governance® with Cerner Millennium is designed to help organizations enforce secure access and corporate compliance policies by reporting who has access to which systems and data by user, job role, or company. With this integration, organizations can analyze the behavior of Cerner Millennium users based on usage analytics via Cerner Millennium's specific out-of-the-box rules and conduct periodic and/or event-based access reviews to ensure that existing access is appropriate to a user's role. This means that organizations can govern access for the duration of each user's role and the identity's lifecycle.

Better Together Integration

The data stored in the Cerner Millennium app, and its security, is critical, and inappropriate use of the data represents a significant risk in the form of regulatory fines, damaged reputation, and high costs of mitigating the damage to customers with compromised credentials.

Benefits

By combining Imprivata Identity Governance with Cerner Millennium, organizations can reap many benefits.

- Imprivata imports employee entitlement data and reports on who has access to which systems and data by user, job role, or company; the solution provides the ability to create and modify roles for Cerner Millennium positions so that they do not create any inherent SOD violations

- Users can build access reports, even for users with no assigned positions, and use identity analytics to determine the risk of individual users

- Conduct critical access reviews based on usage analytics via Cerner Millennium's specific out-of-the-box rules; access reviews can also be triggered from identity lifecycle events such as a department or role change

- Imprivata Identity Governance reconciles Cerner Millennium account changes made outside of the solution

- Conduct periodic and/or event-based access reviews by managers or resource/process owners to ensure that existing access is appropriate to a user's role

Imprivata Identity Governance provides a policy-based approach to simplify and accelerate secure role-based and least privileged access to systems and applications. The solution streamlines the entire user lifecycle, improves auditing processes, and delivers on-demand analytics for faster threat evaluation and remediation.
