imprivata®

Imprivata Enterprise Access Management (formerly Imprivata OneSign® and Imprivata Confirm ID)

The complete financial services solution for simple, secure, system access

More and more, financial services organizations are looking to single sign-on and multifactor authentication capabilities to increase operational efficiency, boost security, and improve the user experience.

The Imprivata platform features comprehensive, proven solutions delivering all of that – and more. Imprivata Enterprise Access Management with single sign-on (formerly Imprivata OneSign) and Imprivata Enterprise Access Management with multifactor authentication (formerly Imprivata Confirm ID) provide convenient, secure access and authentication to help financial services organizations maximize the value of their technology investments. Here's how:

Imprivata Enterprise Access Management with single sign-on

Enable employees to boost productivity and focus on their jobs instead of wrestling with technology. Imprivata Enterprise Access Management with single sign-on does that by replacing the need for repetitive, manual logins with seamless access to shared endpoints, and fast, secure single sign-on into critical tools, legacy and web systems, as well as applications. The result:

- Secure, No Click Access™ that eliminates password fatigue and risky workarounds

- Fast, secure access to on-premises, remote, and cloud applications for all users from any device, anywhere

- The industry's broadest native thin and zero client integration

Imprivata Enterprise Access Management with multifactor authentication

In today's challenging access and security environment, the need for holistic, enterprise-wide multifactor authentication has never been greater. Imprivata Enterprise Access Management with multifactor authentication provides a secure, auditable chain of trust wherever, whenever, and however users interact with data by:

- Centralizing identity and multifactor authentication across all enterprise use cases, including remote access

- Making security invisible with innovative and convenient authentication methods that replace passwords including Hands Free Authentication, badge tap, push token notification, facial recognition, and more

- Protecting data and helping organizations meet compliance for regulations such as PCI DSS, GLBA, and SOX, and for cyber insurance requirements
